The present sequence is one of a large number of 5' ESTS derived from mRNAs encoding secreted proteins. No ORF has yet been conclusively identified within the present sequence. The 5' ESTS were prepared from identified within the present sequence. The 5' ESTS were prepared from forth hann RNAs or polyA+ RNAS derived from 30 different tissues. EST sequences usually correspond mainly to the 3' untranslated region (UTR) of the mRNA because they are often obtained from olige'dT primed cDNA ilbraries. Such ESTS are not well suited for isolating cDNA sequences derived from the 5' ends of mRNAs and even in those cases where longer cDNA sequences have been obtained, the full 5' UTR is rarely included. 5' ESTS are derived from mRNAs with intext 5' ends and can therefore be used to obtain full length cDNAs and genomic DNAs. 5' ESTS are also used in diagnostic, forensic, gene therapy and chromosome mapping procedures. They are used to obtain upstream regulatory sequences and to design

Lemoine C,

The invention relates a nucleic acid which is capable of regulating the transcription of human ATP-binding cassette 1 (ABC1) gene, which is a casual gene for pathologies linked to a dysfunctioning of cholesterol metabolism, including diseases such as atherosclerosis. Polynucheotides of the invention are used to screen candidate molecules or substances that are capable of modulating the transcription of the ABC1 gene. They are used to antisense therapy. Compositions comprising sequences of the invention are used to treat hypercholesterolaemia and atherosclerosis. The present sequence is human ABC1 transcription regulating DNA.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                            ATP-binding cassette transporter-1 (ABCT). ABCT is associated with decreased ApoA-1 mediated efflux of choiesterol. The polymorphisms in ABCT directly affects cellular lipid homeostasis, which is a key factor in the atherogenetic processes. The ABCT polymorphisms are useful for dispossing and treating lipid disorders, cardiovascular diseases (coronary heart disease, atherosclerosis) and inflammatory diseases (psorlasis, lupus erythematosus). The identification of ABCT as a candidate for treatment of inflammatory diseases including rheumatoid arthritis and septic shock. The present sequence is human ABCT gene.

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                              1546 AAACCCCGTAATTECGAGCGAGCGAGTGAGTGGGGCCGGGACCCGAGAGCCGAGCCGACCC 1605
an alternative ATG codon as initiation codon and thereby adding acceptant 40 N-terminal amino acids to the encoded ABCI protein (see AAMS022B). The invention provides 4 common polymorphisms in the ABCI gene. These were identified by sequencing the ABCI gene in different Tangier kindreds. In the variant genes (numbering as in AAT70314), G is changed to A at position 596, T is changed to C at position 1136, A is changed to G at position 596, T is changed to C at position 1136, A is changed to G at position 596, T is changed to C at position 136, A is changed to G at position 596, T is changed to C at position 136, A is changed to G at position 596, T is changed to C at position 136, A is changed to G at position 596, T is changed to C at position of these. All of therefore may affect its function. The 2 most common polymorphisms (6596A) and A258G) are both associated with a decreased in vitro ApoA-I conducted efflux of cholesterol from monounclear phagocytes, a feature typical of Tanglez disease. 3 of the variants (656A, A258GG and 63456C) are significantly increased in a population of estabished coronary heart disease (CHB) relative to CED-free control subjects. The use of the provided ABCI polymorphisms for the diseases, and inflammatory diseases (CHB) relative to CED-free crythematodes) is claimed Modulation of ABCI transcripts of the provided ABCI transcripts of the provided ABCI transcripts of the action of ABCI transcripts.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                              Nucleotide sequence of the 5' flanking region of the human ABCl gene.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                            Gaps
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                     Human; adenosine triphosphate binding cassette protein 1; ABC1; apolipoprotein-mediated mobilisation; choiesterol; Tangier disease; chromosome 9422-9431; heart disease; hypercholesterolemia;

The present sequence represents the 5' flanking region of the huuman adenosine triphosphate (ATP) binding casette protein (ABC) I gene. ABCI resides in cell membranes and utilises ATP indcloysis to transport a wide variety of substrates across the plasma membrane. ABCI is a pivotal protein in the apolipoprotein mediated mobilisation of intracellular protein in the apolipoprotein mediated mobilisation of intracellular choisterol stores. ABCI is defective in Tanglar disease. A genetic choiseterol stores abcorned HDL-choisterol metabolism. The ABCI gene is localised to chromosome 9422-9431. The ABCI genes and proteins are useful for developing pharmaceutical agents for the treatment of heart disease and other disorders associated with hypercholesterolemia and atherosclerosis. The genes are useful for developing screening assays to screen for compounds that regulate the expression of genes associated with care also useful for are also useful as diagnostic indicators of cardiovascular disease and other disorders associated with hyperchoiesterolemia.

                                                                                                                                                                                                                                                                                                                                                                                                            Treating a lower than normal high density lipoprotein-cholesterol (HDL-C) level, a higher than normal triglyceride level, or a cardicvascular disease, by administering a compound that modulates LXR-or RXR-mediated transcriptional activity
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                               The present invention relates to a method for treating a patient diagnosed as having a lower than normal high density lipoprotein-cholesterol (HDL-C) level, a higher than normal triglyceride level, or a cardiovascular disease, involving administering a compound that modulates LXR- or RXR-mediated transcriptional activity or ABCl expression or activity. The LXR gene product may be used in an assay to identify compounds useful for the treatment of a disease or condition selected lower than normal HDL cholesterol level, a higher than normal triglyceride level, and a cardiovascular disease.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                        Human; ATP-binding cassette 1; ABC1 gene regulation; atherosclerosis;

                                                                                                                                                                                                                                                                                                                                                                                          The present sequence represents the 5' flanking region of the huuman adenosine triphosphate (ATP) binding cassette protein (ABC) I gene. ABCI resides in cell membranes and utilises ATP hydrolysis to transport a wide variety of substrates across the plasma membrane. ABCI is a pivotal protein in the apolipoprotein-mediated mobilisation of intracellular cholesterol stores. ABCI is defective in Tangler disease, a genetic disorder characterised by abnormal HDL-cholesterol metabolism. The ABCI gene is localised to chromosome 9q22-9q31. The ABCI genes and proteins are useful for developing pharmaceutical agents for the treatment of heart disease and other disorders associated with hypercholesterolemia and atherosclerosis. The genes are useful for developing screening assays to screen for compounds that regulate the expression of genes associated with cholesterol transport. The genes and proteins are also useful for are also useful as diagnostic indicators of cardiovascular disease and

The invention relates a nucleic acid which is capable of regulating the transcription of human ATP-binding cassette 1 (ABC1) gene, which is a casual gene for pathologies linked to a dysfunctioning of cholesterol metabolism, including diseases such as atherosclerosis. Polynucleotides of the invention are used to screen candidate molecules or substances that are capable of modulating the transcription of the ABC1 gene. They are used in antisense therapy. Compositions comprising sequences of the invention are used to treat hypercholesterolaemia and atherosclerosis. The present sequence is human ABC1 gene exon 1A.
                                                                                                                                                                                                                                                                                                                                                                     Isolated nucleic acid useful for modifying the ATP-binding cassette l (ABCI) and screening for candidate modulatory compounds or substances \,

                                                                                                                                                        0
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                          Constructed at the Institute for Genomic Research (TIG3), Rockville, MD. Genomic DNA isolated from a cloned population of Prpanoscome brucei (TREU927/4 GUTHE 10.1) was mechanically sheared to give a tight size distribution (4 kb). The v + i method used for the library construction is described in detail in Smith, H. and Venter, J.C. (Making small insert Libraries for whole genome shotgun sequencing projects. In Genome Sequencing Approach, eds. M. Vaudin and B. Barrell, Cxford University Press, 1999).

5' EST sequencing of clones from a zebrafish shield stage library,
normalised from 55,000 starting clones by oligonucleotide
                                                                                                                                                            Clark, Aanstad, Hennig, S., Johnson, S.L. and Lehrach, H. EST sequencing of a zebrafish shield stage cDNA library normalised by oligorucleotide fingerprinting
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                     Edwayota: Metazoa; Chordata; Craniata; Vertebrata; Euteleostomi; Eukaryota; Metazoa; Chordata; Catarrhini; Hominidae; Homo.

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                          Constructed at the Institute for Genomic Research (TIGR),
Rockville, MD. Genomic DNA isolated from a cloned population of
Trypanosoma bruce; (TRE0927/4 GUTAt 10.1) was mechanically sheared
to give a tight size distribution (
4 kb). The v + i method used for the library construction is
described in detail in Smith, fi. and Venter, J.C. (Making small
insert libraries for whole genome shotgun sequencing projects. In
Genome Sequencing: A Practical Approach, eds. M. Vaudin and B.
Barrell, Oxford University Press, 1999).
